

a. How the policy data needed for valuation is accessed:

The IT department provides the data required for performing the valuation. IT extracts the data from the Policy Administration System by means of a query. Fields that are necessary for the purpose of valuation are extracted. Validation checks are performed on the data received from the Policy Administration system. The download contains details of both base policies and riders. The data is then converted in to the requisite format, used for valuation purpose, using a Data Conversion System (DCS) package. The actuarial valuation process is done by means of the actuarial software – Prophet

b. How the valuation bases are supplied to the system:

The valuation parameters are classified as:
 Global: These are common across businesses and do not vary according to product, e.g., tax on surplus, inflation, etc.
 Input: These are product-specific, e.g., expenses, commission, etc.
 The non-variants are classified as constants and the individual modal points are generated from the policy download after validation checks. These inputs are fed into the Prophet System for generating the valuation output.
